CHAPTER

FUNCTIONS AND LIMITS

Animation 1.1: Function Machine
Source and credit: eLearn.Punjab
1.1 INTRODUCTION

Functions are important tools by which we describe the real world in mathematical terms. They are used to explain the relationship between variable quantities and hence play a central role in the study of calculus.

1.1.1 Concept of Function

The term function was recognized by a German Mathematician Leibniz (1646 - 1716) to describe the dependence of one quantity on another. The following examples illustrates how this term is used:

(i) The area "A" of a square depends on one of its sides "x" by the formula \( A = x^2 \), so we say that \( A \) is a function of \( x \).
(ii) The volume "V" of a sphere depends on its radius "r" by the formula \( V = \frac{4}{3} \pi r^3 \), so we say that \( V \) is a function of \( r \).

A function is a rule or correspondence, relating two sets in such a way that each element in the first set corresponds to one and only one element in the second set. Thus in, (i) above, a square of a given side has only one area.

And in, (ii) above, a sphere of a given radius has only one volume.

Now we have a formal definition:

1.1.2 Definition (Function - Domain - Range)

A Function \( f \) from a set \( X \) to a set \( Y \) is a rule or a correspondence that assigns to each element \( x \) in \( X \) a unique element \( y \) in \( Y \). The set \( X \) is called the domain of \( f \). The set of corresponding elements \( y \) in \( Y \) is called the range of \( f \).

Unless stated to the contrary, we shall assume hereafter that the set \( X \) and \( Y \) consist of real numbers.

1.1.3 Notation and Value of a Function

If a variable \( y \) depends on a variable \( x \) in such a way that each value of \( x \) determines exactly one value of \( y \), then we say that "\( y \) is a function of \( x \)."

Swiss mathematician Euler (1707-1783) invented a symbolic way to write the statement "\( y \) is a function of \( x \) as \( y = f(x) \), which is read as "\( y \) is equal to \( f \) of \( x \)."

A function can be thought as a computing machine \( f \) that takes an input \( x \), operates on it in some way, and produces exactly one output \( f(x) \). This output \( f(x) \) is called the value of \( f \) at \( x \) or image of \( x \) under \( f \). The output \( f(x) \) is denoted by a single letter, say \( y \), and we write \( y = f(x) \).

The variable \( x \) is called the independent variable of \( f \), and the variable \( y \) is called the dependent variable of \( f \). For now onward we shall only consider the function in which the variables are real numbers and we say that \( f \) is a real valued function of real numbers.

Example 1: Given \( f(x) = x^3 - 2x^2 + 4x - 1 \), find

(i) \( f(0) \) \hspace{1cm} (ii) \( f(1) \) \hspace{1cm} (iii) \( f(-2) \) \hspace{1cm} (iv) \( f(1+x) \) \hspace{1cm} (v) \( f(1/x), x \neq 0 \)

Solution: \( f(x) = x^3 - 2x^2 + 4x - 1 \)

(i) \( f(0) = 0 - 0 + 0 - 1 = -1 \)
(ii) \( f(1) = (1)^3 - 2(1)^2 + 4(1) - 1 = 1 - 2 + 4 - 1 = 2 \)
(iii) \( f(-2) = (-2)^3 - 2(-2)^2 + 4(-2) - 1 = -8 - 8 - 8 - 1 = -21 \)
(iv) \( f(1+x) = (1 + x)^3 - 2(1 + x)^2 + 4(1 + x) - 1 \)
\[ = 1 + 3x + 3x^2 + x^3 - 2 - 4x - 2x^2 + 4 + 4x - 1 \]
\[ = x^3 + x^2 + 3x + 2 \]
1. Quadratic Equations

Example 1: Let \( f(x) = x^2 \). Find the domain and range of \( f \).

\[
(1) \quad f(x) = (1/x)^3 - 2(1/x)^2 + 4 (1/x) - 1 = \frac{1}{x^3} - \frac{2}{x^2} + \frac{4}{x} - 1, \quad x \neq 0
\]

**Solution:** \( f(x) \) is defined for every real number \( x \).

Further for every real number \( x, f(x) = x^2 \) is a non-negative real number. So

- **Domain** \( f = \) Set of all real numbers.
- **Range** \( f = \) Set of all non-negative real numbers.

Example 2: Let \( f(x) = x^2 \). Find the domain and range of \( f \).

**Solution:** \( f(x) \) is defined for every real number \( x \).

Further for every real number \( x, f(x) = x^2 \) is a non-negative real number. So

- **Domain** \( f = \) Set of all real numbers.
- **Range** \( f = \) Set of all non-negative real numbers.

Example 3: Let \( f(x) = x^2 - 4 \). Find the domain and range of \( f \).

**Solution:** We see that if \( x \) is in the interval \(-3 < x < 3\), a square root of a negative number is obtained. Hence no real number \( y = \sqrt{x^2 - 4} \) exists. So

- **Domain** \( f = \) Set of all real numbers except \(-2 \) and \( 2 \).
- **Range** \( f = \) Set of all real numbers.

Example 4: Let \( f(x) = \sqrt{x^2 - 9} \). Find the domain and range of \( f \).

**Solution:** We see that if \( x \) is in the interval \(-3 < x < 3\), a square root of a negative number is obtained. Hence no real number \( y = \sqrt{x^2 - 9} \) exists. So

- **Domain** \( f = \) Set of all positive real numbers except \(-2 \) and \( 2 \).
- **Range** \( f = \) Set of all non-negative real numbers except \(-3 \).

1.1.4 Graphs of Algebraic functions

If \( f \) is a real-valued function of real numbers, then the graph of \( f \) in the \( xy \)-plane is defined to be the graph of the equation \( y = f(x) \).

The graph of a function \( f \) is the set of points \( \{(x, y) \mid y = f(x)\} \), \( x \) is in the domain of \( f \) in the Cartesian plane for which \( (x, y) \) is an ordered pair of \( f \). The graph provides a visual technique for determining whether the set of points represents a function or not. If a vertical line intersects a graph in more than one point, it is not the graph of a function.
1.1.5 Graph of Functions Defined Piece-wise.

When the function \( f \) is defined by two rules, we draw the graphs of two functions as explained in the following example:

Example 7: Find the domain and range of the function defined by:
\[
f(x) = \begin{cases} 
  x & \text{when } 0 \leq x \leq 1 \\
  x - 1 & \text{when } 1 < x \leq 2
\end{cases}
\]
also draw its graph.

Solution: Here domain \( f = [0, 1] \cup [1, 2] = [0, 2] \). This function is composed of the following two functions:
(i) \( f(x) = x \) when \( 0 \leq x \leq 1 \)
(ii) \( f(x) = x - 1 \), when \( 1 < x \leq 2 \)
To find the table of values of \( x \) and \( y = f(x) \) in each case, we take suitable values to \( x \) in the domain \( f \). Thus

Table for \( y = f(x) = x \):

<table>
<thead>
<tr>
<th>( x )</th>
<th>0</th>
<th>0.5</th>
<th>0.8</th>
<th>1</th>
</tr>
</thead>
<tbody>
<tr>
<td>( y = f(x) )</td>
<td>0</td>
<td>0.5</td>
<td>0.8</td>
<td>1</td>
</tr>
</tbody>
</table>

Table for \( y = f(x) = x - 1 \):

<table>
<thead>
<tr>
<th>( x )</th>
<th>1.1</th>
<th>1.5</th>
<th>1.8</th>
<th>2</th>
</tr>
</thead>
<tbody>
<tr>
<td>( y = f(x) )</td>
<td>0.1</td>
<td>0.5</td>
<td>0.8</td>
<td>1</td>
</tr>
</tbody>
</table>

Plotting the points \( (x, y) \) and joining them we get two straight lines as shown in the figure. This is the graph of the given function.

1.2 TYPES OF FUNCTIONS

Some important types of functions are given below:

1.2.1 Algebraic Functions

Algebraic functions are those functions which are defined by algebraic expressions. We classify algebraic functions as follows:

(i) Polynomial Function
A function \( P \) of the form \( P(x) = a_nx^n + a_{n-1}x^{n-1} + a_{n-2}x^{n-2} + \ldots + a_2x^2 + a_1x + a_0 \)
for all \( x \), where the coefficient \( a_n, a_{n-1}, a_{n-2}, \ldots, a_2, a_1, a_0 \) are real numbers and the exponents are non-negative integers, is called a polynomial function.

The domain and range of \( P(x) \) are, in general, subsets of real numbers.

For example, if \( a_n \neq 0 \), then \( P(x) \) is called a polynomial function of degree \( n \) and \( a_n \) is the leading coefficient of \( P(x) \).

For example, \( P(x) = 2x^4 - 3x^2 + 2x - 1 \) is a polynomial function of degree 4 with leading coefficient 2.

(ii) Linear Function
If the degree of a polynomial function is \( 1 \), then it is called a linear function. A linear function is of the form:
\[ f(x) = ax + b \quad (a \neq 0), \]
where both \( a, b \) are real numbers.

For example, \( f(x) = 3x + 4 \) or \( y = 3x + 4 \) is a linear function. Its domain and range are the set of real numbers.

(iii) Identity Function
For any set \( X \), a function \( I : X \to X \) of the form \( I(x) = x \quad \forall x \in X \), is called an identity function. Its domain and range is the set \( X \) itself. In particular, if \( X = R \), then \( I(x) = x \), for all \( x \in R \), is the identity function.

(iv) Constant Function
Let \( X \) and \( Y \) be sets of real numbers. A function \( C : X \to Y \) defined by \( C(x) = a \), \( \forall x \in X \), \( a \in Y \) and fixed, is called a constant function.
For example, \( C : R \to R \) defined by \( C(x) = 2 \), \( \forall x \in R \) is a constant function.

(v) Rational Function
A function \( R(x) \) of the form \( R(x) = \frac{P(x)}{Q(x)} \), where both \( P(x) \) and \( Q(x) \) are polynomial functions and \( Q(x) \neq 0 \), is called a rational function.

The domain of a rational function \( R(x) \) is the set of all real numbers \( x \) for which \( Q(x) \neq 0 \).
1. Quadratic Equations

1. Functions and Limits

(i) \( y = \sin x \), Domain = \( R \), Range \(-1 \leq y \leq 1\).
(ii) \( y = \cos x \), Domain = \( R \), Range \(-1 \leq y \leq 1\).
(iii) \( y = \tan x \), Domain = \( (x : x \in R \text{ and } x \neq m, m \text{ an integer}) \), Range = \( R \).
(iv) \( y = \cot x \), Domain = \( (x : x \in R \text{ and } x \neq n \pi, n \text{ an integer}) \), Range = \( R \).
(v) \( y = \sec x \), Domain = \( (x : x \in R \text{ and } x \neq (2n + 1)\pi/2, n \text{ an integer}) \), Range = \( R \).
(vi) \( y = \csc x \), Domain = \( (x : x \in R \text{ and } x \neq n \pi, n \text{ an integer}) \), Range = \( R \).

1.2 Inverse Trigonometric Functions

We denote and define inverse trigonometric functions as follows:

(i) \( y = \sin^{-1} x \iff x = \sin y \), where \(-\pi/2 \leq y \leq \pi/2, -1 \leq x \leq 1\).
(ii) \( y = \cos^{-1} x \iff x = \cos y \), where \(0 \leq y \leq \pi, -1 \leq x \leq 1\).
(iii) \( y = \tan^{-1} x \iff x = \tan y \), where \(-\pi/2 < y < \pi/2, -\infty < x < \infty\).

1.2.3 Inverse Trigonometric Functions

1.2.4 Exponential Function

A function, in which the variable appears as exponent (power), is called an exponential function. The functions, \( y = e^{ax} \), \( y = e^x \), \( y = 2^x = e^{x \log 2} \), etc, are exponential functions of \( x \).

1.2.5 Logarithmic Function

If \( x = a^y \), then \( y = \log_a x \), where \( a > 0, a \neq 1 \) is called a logarithmic function of \( x \).

(i) If \( a = 10 \), then we have \( \log_{10} x \) (written as \( \lg x \)) which is known as the common logarithm of \( x \).
(ii) If \( a = e \), then we have \( \log_e x \) (written as \( \ln x \)) which is known as the natural logarithm of \( x \).

1.2.6 Hyperbolic Functions

(i) \( \sinh x = \frac{e^x - e^{-x}}{2} \) is called hyperbolic sine function. Its domain and range are the set of all real numbers.
(ii) \( \cosh x = \frac{e^x + e^{-x}}{2} \) is called hyperbolic cosine function. Its domain is the set of all real numbers and the range is the set of all numbers in the interval \([1, +\infty)\).
(iii) The remaining four hyperbolic functions are defined in terms of the hyperbolic sine and the hyperbolic cosine function as follows:

- \( \tanh x = \frac{\sinh x}{\cosh x} = \frac{e^x - e^{-x}}{e^x + e^{-x}} \)
- \( \coth x = \frac{\cosh x}{\sinh x} = \frac{e^x + e^{-x}}{e^x - e^{-x}} \)
- \( \sech x = \frac{2}{e^x + e^{-x}} \)
- \( \csch x = \frac{2}{e^x - e^{-x}} \)

The hyperbolic functions have some properties that resemble to those of trigonometric functions.

1.2.7 Inverse Hyperbolic Functions

The inverse hyperbolic functions are expressed in terms of natural logarithms and we shall study them in higher classes.

(i) \( \sinh^{-1} x = \ln(x + \sqrt{x^2 + 1}), \text{ for all } x \)
(ii) \( \cosh^{-1} x = \ln(x + \sqrt{x^2 - 1}), x \geq 1 \)
(iii) \( \tanh^{-1} x = \frac{1}{2} \ln \left( \frac{1 + x}{1 - x} \right), \text{ for all } |x| < 1 \)
(iv) \( \coth^{-1} x = \ln \left( \frac{x + \sqrt{x^2 - 1}}{x - \sqrt{x^2 - 1}} \right), 0 < x \leq 1 \)
(v) \( \sech^{-1} x = \ln \left( \frac{1 + x}{x} \right), |x| < 1 \)
(vi) \( \csch^{-1} x = \ln \left( \frac{x}{x + \sqrt{x^2 + 1}} \right), x \neq 0 \)

1.2.8 Explicit Function

If \( y \) is easily expressed in terms of the independent variable \( x \), then \( y \) is called an explicit function of \( x \). For example:

(i) \( y = x^2 + 2x - 1 \) (ii) \( y = \sqrt{x+1} \) are explicit functions of \( x \).
1. Quadratic Equations

1.2.9 Implicit Function

If \( x \) and \( y \) are so mixed up and \( y \) cannot be expressed in terms of the independent variable \( x \), then \( y \) is called an implicit function of \( x \). For example,

(i) \( x^2 + xy + y^2 = 2 \)
(ii) \( \frac{xy^2 - y + 9}{xy} = 1 \)

are implicit functions of \( x \) and \( y \).

Symbolically it is written as \( f(x, y) = 0 \).

1.2.10 Even Function

A function \( f \) is said to be even if \( f(-x) = f(x) \), for every number \( x \) in the domain of \( f \). For example, \( f(x) = x^2 \) and \( f(x) = \cos x \) are even functions of \( x \).

For example, \( f(x) = x^2 \) and \( f(x) = \cos x \) are even functions of \( x \).

Here

\( f(-x) = (-x)^2 = x^2 = f(x) \) and \( f(-x) = \cos(-x) = \cos x = f(x) \)

1.2.11 Odd Function

A function \( f \) is said to be odd if \( f(-x) = -f(x) \), for every number \( x \) in the domain of \( f \). For example, \( f(x) = x^3 \) and \( f(x) = \sin x \) are odd functions of \( x \).

For example, \( f(x) = x^3 \) and \( f(x) = \sin x \) are odd functions of \( x \).

Here

\( f(-x) = (-x)^3 = -x^3 = -f(x) \) and \( f(-x) = \sin(-x) = -\sin x = -f(x) \)

Note: In both the cases, for each \( x \) in the domain of \( f \), \( -x \) must also be in the domain of \( f \).

Example 1: Show that the parametric equations \( x = a \cos t \) and \( y = a \sin t \) represent the equation of the circle \( x^2 + y^2 = a^2 \).

Solution: The parametric equations are

\( x = a \cos t \) (i)
\( y = a \sin t \) (ii)

We eliminate the parameter "\( t \)" from equations (i) and (ii).

By squaring we get,

\( x^2 = a^2 \cos^2 t \)
\( y^2 = a^2 \sin^2 t \)

By adding we get,

\( x^2 + y^2 = a^2 \cos^2 t + a^2 \sin^2 t \)
\( \therefore x^2 + y^2 = a^2 \), which is equation of the circle.

Example 2: Prove the identities

(i) \( \cosh^2 x - \sinh^2 x = 1 \)  
(ii) \( \cosh^2 x + \sinh^2 x = \cosh 2x \)

Solution: We know that

\( \sinh x = \frac{e^x - e^{-x}}{2} \) (1)
and \( \cosh x = \frac{e^x + e^{-x}}{2} \) (2)

Squaring (1) and (2) we have

\( \sinh^2 x = \frac{e^{2x} + e^{-2x} - 2}{4} \) and \( \cosh^2 x = \frac{e^{2x} + e^{-2x} + 2}{4} \)

Now (i)

\( \cosh^2 x - \sinh^2 x = \frac{e^{2x} + e^{-2x} + 2 - e^{2x} - e^{-2x} - 2}{4} = 0 \)
\( \therefore \cosh^2 x - \sinh^2 x = 1 \)
1. Quadratic Equations

and (ii) \( \cosh^2 x + \sinh^2 x = \frac{e^{2x} + e^{-2x} + 2}{4} + \frac{e^{2x} + e^{-2x} - 2}{4} = \frac{2e^{2x} + 2e^{-2x}}{4} = \frac{e^{2x} + e^{-2x}}{2} \)

\( \therefore \) \( \cosh^2 x + \sinh^2 x = \cosh 2x \)

Example 3: Determine whether the following functions are even or odd.
(a) \( f(x) = 3x^4 - 2x^7 + 7 \)  
(b) \( f(x) = \frac{3x}{x^4 + 1} \)  
(c) \( f(x) = \sin x + \cos x \)

Solution:
(a) \( f(-x) = 3(-x)^4 - 2(-x)^7 + 7 = 3x^4 - 2x^7 + 7 = f(x) \)
Thus \( f(x) = 3x^4 - 2x^7 + 7 \) is even.

(b) \( f(-x) = \frac{3(-x)}{(-x)^4 + 1} - \frac{3x}{x^4 + 1} = -f(x) \)
Thus \( f(x) = \frac{3x}{x^4 + 1} \) is odd

(c) \( f(-x) = \sin(-x) + \cos(-x) = -\sin x + \cos x = f(x) \)
Thus \( f(x) = \sin x + \cos x \) is neither even nor odd

EXERCISE 1.1

1. Given that: (a) \( f(x) = x^2 - x \)  
   (b) \( f(x) = \sqrt{x + 4} \)
   Find (i) \( f(-2) \)  
   (ii) \( f(0) \)  
   (iii) \( f(x - 1) \)  
   (iv) \( f(x^2 + 4) \)

2. Find \( \frac{f(a + h) - f(a)}{h} \) and simplify where,
   (i) \( f(x) = 6x - 9 \)  
   (ii) \( f(x) = \sin x \)  
   (iii) \( f(x) = x^2 + 2x^2 - 1 \)  
   (iv) \( f(x) = \cos x \)

3. Express the following:
   (a) The perimeter \( P \) of square as a function of its area \( A \).
   (b) The area \( A \) of a circle as a function of its circumference \( C \).
   (c) The volume \( V \) of a cylinder as a function of its base.

4. Find the domain and the range of the function \( g \) defined below, and
   (i) \( g(x) = 2x - 5 \)  
   (ii) \( g(x) = \sqrt{x^2 - 4} \)  
   (iii) \( g(x) = \sqrt{x + 1} \)  
   (iv) \( g(x) = \sqrt{x - 3} \)  
   (v) \( g(x) = \left\{ \begin{array}{ll} 6x + 7 & , x \leq -2 \\ 4 - 3x & , -2 < x \end{array} \right\} \)
   (vi) \( g(x) = \left\{ \begin{array}{ll} x - 1 & , x < 3 \\ 2x + 1 , & 3 \leq x \end{array} \right\} \)
   (vii) \( g(x) = \frac{x^2 - 3x + 2}{x + 1} \)  
   (viii) \( g(x) = \frac{x^2 - 16}{x - 4} \)

5. Given \( f(x) = x^3 - ax^2 + bx + 1 \)
   If \( f(2) = -3 \) and \( f(-1) = 0 \). Find the values of \( a \) and \( b \).

6. A stone falls from a height of 60m on the ground, the height \( h \) after \( x \) seconds is approximately given by \( h(x) = 40 - 10x^2 \)
   (i) What is the height of the stone when:
      (a) \( x = 1 \) sec?  
      (b) \( x = 1.5 \) sec?  
      (c) \( x = 1.7 \) sec?
   (ii) When does the stone strike the ground?

7. Show that the parametric equations:
   (i) \( x = at^2 , y = 2at \) represent the equation of parabola
   \( y^2 = 4ax \)
   (ii) \( x = a\cos \theta , y = b\sin \theta \) represent the equation of ellipse
   \( \frac{x^2}{a^2} + \frac{y^2}{b^2} = 1 \)
   (iii) \( x = a\sec \theta , y = bt\tan \theta \) represent the equation of hyperbola
   \( \frac{x^2}{a^2} - \frac{y^2}{b^2} = 1 \)

8. Prove the identities:
   (i) \( \sinh 2x = 2\sinh x \cosh x \)
   (ii) \( \cosh^2 x = 1 - \tanh^2 x \)
   (iii) \( \operatorname{csch}^2 x = \coth^2 x - 1 \)
1. Quadratic Equations

1.3 COMPOSITION OF FUNCTIONS AND INVERSE OF A FUNCTION

Let \( f \) be a function from set \( X \) to set \( Y \) and \( g \) be a function from set \( Y \) to set \( Z \). The composition of \( f \) and \( g \) is a function, denoted by \( g \circ f \), from \( X \) to \( Z \) and is defined by:

\[
(g \circ f)(x) = g(f(x)), \quad \text{for all } x \in X.
\]

### 1.3.1 Composition of Functions

#### Explanation

Consider two real valued functions \( f \) and \( g \) defined by

\[
f(x) = 2x + 3 \quad \text{and} \quad g(x) = x^2
\]

then \( g(f(x)) = g(2x + 3) = (2x + 3)^2 \)

The arrow diagram of two consecutive mappings, \( f \) followed by \( g \), denoted by \( g \circ f \) is shown in the figure.

Thus a single composite function \( g(f(x)) \) is equivalent to two successive functions \( f \) followed by \( g \).

#### Example 1:

Let the real valued functions \( f \) and \( g \) be defined by

\[
f(x) = 2x + 1 \quad \text{and} \quad g(x) = x^2 - 1
\]

Obtain the expressions for

(i) \( f(g(x)) \)  
(ii) \( g(f(x)) \)  
(iii) \( f^{-1}(x) \)  
(iv) \( g^{-1}(x) \)

### 1.3.2 Inverse of a Function

Let \( f \) be a one-one function from \( X \) onto \( Y \). The inverse function of \( f \) denoted by \( f^{-1} \), is a function from \( Y \) onto \( X \) and is defined by:

\[
x = f^{-1}(y), \quad \forall y \in Y \quad \text{if and only if} \quad y = f(x), \quad \forall x \in X.
\]

**Illustration by arrow diagram**

The inverse function reverses the correspondence of the original function, so that

\[
f^{-1}(y) = x, \quad \text{when} \quad f(x) = y
\]

and

\[
f(x) = y, \quad \text{when} \quad f^{-1}(y) = x
\]

We can find the composition of the functions \( f \) and \( f^{-1} \) as follows:

\[
(f^{-1} \circ f)(x) = f^{-1}(f(x)) = f^{-1}(y) = x
\]

and

\[
(f \circ f^{-1})(y) = f(f^{-1}(y)) = f(x) = y
\]

We note that \( f^{-1} \circ f \) and \( f \circ f^{-1} \) are identity mappings on the domain and range of \( f \) and \( f^{-1} \) respectively.

### 1.3.3 Algebraic Method to find the Inverse Function

The inverse function can be found by using the algebraic method as explained in the following example:
Example 2: Let \( f: \mathbb{R} \to \mathbb{R} \) be the function defined by \( f(x) = 2x + 1 \). Find \( f^{-1}(x) \)

Remember that:
The change of name of variable in the definition of function does not change that function where the domain and range coincide.

Solution: We find the inverse of \( f \) as follows:
Write \( f(x) = 2x + 1 = y \)
So that \( y \) is the image of \( x \) under \( f \).
Now solve this equation for \( x \) as follows:
\[
2x = y - 1 \\
\Rightarrow x = \frac{y - 1}{2} \\
\therefore \quad f^{-1}(y) = \frac{1}{2}(y - 1) \\ x = f^{-1}(y)
\]

To find \( f^{-1}(x) \), replace \( y \) by \( x \).
\[
\therefore \quad f^{-1}(x) = \frac{1}{2}(x - 1)
\]

Verification:
\[
f(f^{-1}(x)) = f\left(\frac{1}{2}(x - 1)\right) = 2\left[\frac{1}{2}(x - 1)\right] + 1 = x
\]
and \( f^{-1}(f(x)) = f^{-1}(2x + 1) = \frac{1}{2}(2x + 1 - 1) = x \)

Example 3: Without finding the inverse, state the domain and range of \( f^{-1} \), where \( f(x) = 2 + \sqrt{x-1} \)

Solution: We see that \( f \) is not defined when \( x < 1 \).
\[
\therefore \quad \text{Domain of } f^{-1} = [1, +\infty)
\]
As \( x \) varies over the interval \([1, +\infty)\), the value of \( \sqrt{x-1} \) varies over the interval \([0, +\infty)\).

So the value of \( f(x) = 2 + \sqrt{x-1} \) varies over the interval \([2, +\infty)\).
Therefore range \( f = [2, +\infty) \).
By definition of inverse function \( f^{-1} \), we have
domain \( f^{-1} = \text{range of } f = [2, +\infty) \)
and range \( f^{-1} = \text{domain of } f = [1, +\infty) \)

EXERCISE 1.2

1. The real valued functions \( f \) and \( g \) are defined below. Find
(a) \( f \circ g \)(x) \quad (b) \( g \circ f \)(x) \quad (c) \( f \circ f \)(x) \quad (d) \( g \circ g \)(x)

(i) \( f(x) = 2x + 1 \) ; \( g(x) = \frac{3}{x - 1} \), \( x \neq 1 \)
(ii) \( f(x) = \sqrt{x-1} \) ; \( g(x) = \frac{1}{x} \), \( x \neq 0 \)
(iii) \( f(x) = \frac{1}{\sqrt{x-1}} \), \( x \neq 1 \) ; \( g(x) = (x^2 + 1)^2 \)
(iv) \( f(x) = 3x^2 - 2x^2 \) ; \( g(x) = \frac{2}{\sqrt{x}} \), \( x \neq 0 \)

2. For the real valued function, \( f \) defined below, find
(a) \( f^{-1}(x) \) \quad (b) \( f^{-1}(-1) \) and verify \( f(f^{-1}(x)) = f^{-1}(f(x)) = x \)
(i) \( f(x) = -2x + 8 \) \quad (ii) \( f(x) = 3x^3 + 7 \)
(iii) \( f(x) = -(x + 9)^3 \) \quad (iv) \( f(x) = \frac{2x + 1}{x - 1} \), \( x > 1 \)

3. Without finding the inverse, state the domain and range of \( f^{-1} \).

(i) \( f(x) = \sqrt{x + 2} \) \quad (iii) \( f(x) = \frac{1}{x + 3} \), \( x \neq -3 \)
(ii) \( f(x) = \frac{x - 1}{x - 4} \), \( x \neq 4 \) \quad (iv) \( f(x) = (x - 5)^2 \), \( x \geq 5 \)
1.4 LIMIT OF A FUNCTION AND THEOREMS ON LIMITS

The concept of limit of a function is the basis on which the structure of calculus rests. Before the definition of the limit of a function, it is essential to have a clear understanding of the meaning of the following phrases:

1.4.1 Meaning of the Phrase "x approaches zero"

Suppose a variable x assumes in succession a series of values as

\[ \frac{1}{2}, \frac{1}{4}, \frac{1}{8}, \frac{1}{16}, \ldots \text{i.e., } \frac{1}{2}, \frac{1}{2^2}, \frac{1}{2^3}, \ldots, \frac{1}{2^n}, \ldots \]

We notice that x is becoming smaller and smaller as n increases and can be made as small as we please by taking n sufficiently large. This unending decrease of x is symbolically written as \( x \to 0 \) and is read as "x approaches zero" or "x tends to zero".

Note: The symbol \( x \to 0 \) is quite different from \( x = 0 \)

(i) \( x \to 0 \) means that x is very close to zero but not actually zero.

(ii) \( x = 0 \) means that x is actually zero.

1.4.2 Meaning of the Phrase "x approaches infinity"

Suppose a variable x assumes in succession a series of values as

\[ 1, 10, 100, 1000, 10000, \ldots \text{i.e., } 1, 10^1, 10^2, 10^3, \ldots \]

It is clear that x is becoming larger and larger as n increases and can be made as large as we please by taking n sufficiently large. This unending increase of x is symbolically written as \( x \to \infty \) and is read as "x approaches infinity" or "x tends to infinity".

1.4.3 Meaning of the Phrase "x approaches a"

Symbolically it is written as \( x \to a \) which means that x is sufficiently close to but different from the number a, from both the left and right sides of a i.e; \( x - a \) becomes smaller and smaller as we please but \( x - a \neq 0 \).
The table of values of $f(x)$ for different values of $x$ as $x$ approaches 2 from left and right is as follows:

<table>
<thead>
<tr>
<th>$x$</th>
<th>1</th>
<th>1.5</th>
<th>1.8</th>
<th>1.9</th>
<th>1.99</th>
<th>1.999</th>
<th>2.0001</th>
<th>2.001</th>
<th>2.1</th>
<th>2.2</th>
<th>2.5</th>
<th>3</th>
</tr>
</thead>
</table>

The table shows that, as $x$ gets closer and closer to 2 (sufficiently close to 2), from both sides, $f(x)$ gets closer and closer to 8.

We say that 8 is the limit of $f(x)$ when $x$ approaches 2 and is written as:

$$\lim_{x \to 2} f(x) = 8$$

### 1.4.5 Limit of a Function

Let a function $f(x)$ be defined in an open interval near the number “$a$” (need not be at $a$).

If, as $x$ approaches “$a$” from both left and right side of “$a$”, $f(x)$ approaches a specific number “$L$”, then “$L$”, is called the limit of $f(x)$ as $x$ approaches $a$.

Symbolically it is written as:

$$\lim_{x \to a} f(x) = L$$

It is neither desirable nor practicable to find the limit of a function by numerical approach. We must be able to evaluate a limit in some mechanical way. The theorems on limits will serve this purpose. Their proofs will be discussed in higher classes.

### 1.4.6 Theorems on Limits of Functions

Let $f$ and $g$ be two functions, for which $\lim_{x \to a} f(x) = L$ and $\lim_{x \to a} g(x) = M$, then

#### Theorem 1: The limit of the sum of two functions is equal to the sum of their limits.

$$\lim_{x \to a} [f(x) + g(x)] = \lim_{x \to a} f(x) + \lim_{x \to a} g(x) = L + M$$

For example, $\lim_{x \to 1} (x+5) = \lim_{x \to 1} x + \lim_{x \to 1} 5 = 1 + 5 = 6$

#### Theorem 2: The limit of the difference of two functions is equal to the difference of their limits.

$$\lim_{x \to a} [f(x) - g(x)] = \lim_{x \to a} f(x) - \lim_{x \to a} g(x) = L - M$$

For example, $\lim_{x \to 3} (x - 5) = \lim_{x \to 3} x - \lim_{x \to 3} 5 = 3 - 5 = -2$

#### Theorem 3: If $k$ is any real number, then

$$\lim_{x \to a} [kf(x)] = k \lim_{x \to a} f(x) = kL$$

For example: $\lim_{x \to 2} (3x) = 3 \lim_{x \to 2} x = 3 \cdot 2 = 6$

#### Theorem 4: The limit of the product of the functions is equal to the product of their limits.

$$\lim_{x \to a} [fg(x)] = \left[\lim_{x \to a} f(x)\right] \left[\lim_{x \to a} g(x)\right] = LM$$

For example: $\lim_{x \to a} (2x)(x + 4) = \left[\lim_{x \to a} (2x)\right] \left[\lim_{x \to a} (x + 4)\right] = (2)(5) = 10$

#### Theorem 5: The limit of the quotient of the functions is equal to the quotient of their limits provided the limit of the denominator is non-zero.

$$\lim_{x \to a} \frac{f(x)}{g(x)} = \frac{\lim_{x \to a} f(x)}{\lim_{x \to a} g(x)} = \frac{L}{M}, \quad g(x) \neq 0, M \neq 0$$

For example: $\lim_{x \to 2} \frac{3x+4}{x+3} = \frac{\lim_{x \to 2} (3x+4)}{\lim_{x \to 2} (x+3)} = \frac{6+4}{2+3} = \frac{10}{5} = 2$

#### Theorem 6: Limit of $[f(x)]^n$, where $n$ is an integer

$$\lim_{x \to a} [f(x)]^n = \left(\lim_{x \to a} f(x)\right)^n = L^n$$

For example: $\lim_{x \to 2} (2x-3)^3 = \left(\lim_{x \to 2} (2x-3)\right)^3 = (5)^3 = 125$

We conclude from the theorems on limits that limits are evaluated by merely substituting the number that $x$ approaches into the function.
Example: If \( P(x) = a_n x^n + a_{n-1} x^{n-1} + \ldots + a_1 x + a_0 \) is a polynomial function of degree \( n \), then show that \( \lim_{x \to c} P(x) = P(c) \)

Solution: Using the theorems on limits, we have

\[
\lim_{x \to c} P(x) = \lim_{x \to c} \left( a_n x^n + a_{n-1} x^{n-1} + \ldots + a_1 x + a_0 \right) \\
= a_n \lim_{x \to c} x^n + a_{n-1} \lim_{x \to c} x^{n-1} + \ldots + a_1 \lim_{x \to c} x + a_0 \\
= a_n c^n + a_{n-1} c^{n-1} + \ldots + a_1 c + a_0 \\
\therefore \lim_{x \to c} P(x) = P(c)
\]

1.5 LIMITS OF IMPORTANT FUNCTIONS

If, by substituting the number that \( x \) approaches into the function, we get \( \frac{0}{0} \) form, then we evaluate the limit as follows:

We simplify the given function by using algebraic technique of making factors if possible and cancel the common factors. The method is explained in the following important limits.

1.5.1 \( \lim_{x \to a} \frac{x^n - a^n}{x - a} = na^{n-1} \) where \( n \) is an integer and \( a > 0 \)

Case 1: Suppose \( n \) is a positive integer.

By substituting \( x = a \), we get \( \frac{0}{0} \) form. So we make factors as follows:

\[
x^n - a^n = (x - a)(x^{n-1} + ax^{n-2} + a^2 x^{n-3} + \ldots + a^{n-1})
\]

\[
\therefore \lim_{x \to a} \frac{x^n - a^n}{x - a} = \lim_{x \to a} \frac{(x - a)(x^{n-1} + ax^{n-2} + a^2 x^{n-3} + \ldots + a^{n-1})}{x - a}
\]

\[
= \lim_{x \to a} (x^{n-1} + ax^{n-2} + a^2 x^{n-3} + \ldots + a^{n-1}) \quad \text{(polynomial function)}
\]

\[
= a^{n-1} + a^2 a^{n-3} + \ldots + a^{n-1} \quad (n \text{ terms})
\]

\[
= na^{n-1}
\]

1.5.2 \( \lim_{x \to a} \sqrt[n]{x + a} - \sqrt[n]{a} = \frac{1}{\sqrt[n]{a} + \sqrt[n]{a}} \) for \( n \) is a positive integer.

Now \( \frac{x^n - a^n}{x - a} = \frac{x^n - a^n}{x - a} \) (a \( \neq 0 \))

\[
\therefore \lim_{x \to a} \frac{x^n - a^n}{x - a} = \lim_{x \to a} \left( \frac{1}{x + a} \right) \left( \frac{x^n - a^n}{x - a} \right)
\]

\[
= \frac{-1}{a} \left( \frac{1}{a^{n-1}} \right) \quad \text{(By case 1)}
\]

\[
\therefore \lim_{x \to a} \frac{x^n - a^n}{x - a} = na^{n-1} \quad (n = - m)
\]

Case II: Suppose \( n \) is a negative integer (say \( n = -m \)), where \( m \) is a positive integer.

By substituting \( x = 0 \), we have \( \frac{0}{0} \) form, so rationalizing the numerator.

\[
\therefore \lim_{x \to 0} \frac{\sqrt[n]{x + a} - \sqrt[n]{a}}{x} = \lim_{x \to 0} \left( \frac{1}{\sqrt[n]{x + a} + \sqrt[n]{a}} \right)
\]

\[
= \lim_{x \to 0} \frac{x + a}{x(\sqrt[n]{x + a} + \sqrt[n]{a})}
\]

\[
= \lim_{x \to 0} \frac{1}{\sqrt[n]{x + a} + \sqrt[n]{a}} = \frac{1}{\sqrt[n]{a} + \sqrt[n]{a}} \quad \text{(By case 1)}
\]

\[
\therefore \lim_{x \to 0} \frac{\sqrt[n]{x + a} - \sqrt[n]{a}}{x} = \frac{1}{\sqrt[n]{a} + \sqrt[n]{a}}
\]
Example 1: Evaluate

(i) \( \lim_{x \to 1} \frac{x^2 - 1}{x^2 - x} \)

(ii) \( \lim_{x \to 3} \frac{x - 3}{\sqrt{x} - \sqrt{3}} \)

Solution: (i) \( \lim_{x \to 1} \frac{x^2 - 1}{x^2 - x} = \lim_{x \to 1} \frac{(x - 1)(x + 1)}{x(x - 1)} = \lim_{x \to 1} \frac{x + 1}{x} = \frac{1 + 1}{1} = 2 \)

(ii) \( \lim_{x \to 3} \frac{x - 3}{\sqrt{x} - \sqrt{3}} = \lim_{x \to 3} \frac{(x - 3)(\sqrt{x} + \sqrt{3})}{x - 3} \)

\[ = \lim_{x \to 3} (\sqrt{x} + \sqrt{3}) \]

\[ = (\sqrt{3} + \sqrt{3}) \]

\[ = 2\sqrt{3} \]

1.5.3 Limit at Infinity

We have studied the limits of the functions \( f(x) \), \( g(x) \) and \( \frac{f(x)}{g(x)} \) when \( x \to c \) (a number)

Let us see what happens to the limit of the function \( f(x) \) if \( c \) is \( +\infty \) or \( -\infty \) (limits at infinity) i.e. when \( x \to +\infty \) and \( x \to -\infty \).

(a) Limit as \( x \to +\infty \)

Let \( f(x) = \frac{1}{x} \), when \( x \neq 0 \)

This function has the property that the value of \( f(x) \) can be made as close as we please to zero when the number \( x \) is sufficiently large.

We express this phenomenon by writing \( \lim_{x \to +\infty} \frac{1}{x} = 0 \)

(b) Limit as \( x \to -\infty \). This type of limits are handled in the same way as limits as \( x \to +\infty \).

i.e. \( \lim_{x \to -\infty} \frac{1}{x} = 0 \), where \( x \neq 0 \)

The following theorem is useful for evaluating limit at infinity.

Theorem: Let \( p \) be a positive rational number. If \( x^p \) is defined, then

\[ \lim_{x \to +\infty} \frac{a}{x^p} = 0 \]

and

\[ \lim_{x \to -\infty} \frac{a}{x^p} = 0 \], where \( a \) is any real number.

For example,

\[ \lim_{x \to +\infty} \frac{6}{x^2} = 0 \]

\[ \lim_{x \to -\infty} \frac{-5}{x^2} = \lim_{x \to +\infty} \frac{-5}{x^2} = 0 \]

and

\[ \lim_{x \to +\infty} \frac{1}{x^3} = \lim_{x \to -\infty} \frac{1}{x^3} = 0 \]

1.5.4 Method for Evaluating the Limits at Infinity

In this case we first divide each term of both the numerator and the denominator by the highest power of \( x \) that appears in the denominator and then use the above theorem.

Example 2: Evaluate \( \lim_{x \to +\infty} \frac{5x^4 - 10x^2 + 1}{-3x^2 + 10x^2 + 50} \)

Solution:

Dividing up and down by \( x^4 \), we get

\[ \lim_{x \to +\infty} \frac{5x^4 - 10x^2 + 1}{-3 + 10x^2 + 50} = \lim_{x \to +\infty} \frac{5x^4 - 10x^2 + 1 + 1x^3}{-3 + 10x^2 + 50} = \frac{-3 + 0 + 0}{-3 + 0 + 0} = \infty \]

Example 3: Evaluate \( \lim_{x \to -\infty} \frac{4x^3 - 5x^2}{3x^2 + 2x^3 + 1} \)

Solution:

Since \( x < 0 \), so dividing up and down by \((-x)^3 = -x^3\), we get

\[ \lim_{x \to -\infty} \frac{-4x^3 + 5x^2}{-3 - 2x^3 - 1x^3} = \frac{0 + 0}{-3 - 0 - 0} = 0 \]
Example 4: Evaluate

(i) \( \lim_{x \to \infty} \frac{2 - 3x}{\sqrt{3 + 4x^2}} \)  
(ii) \( \lim_{x \to -\infty} \frac{2 - 3x}{\sqrt{3 + 4x^2}} \)

Solution:

(i) Here \( \frac{2 - 3x}{\sqrt{3 + 4x^2}} = -\) as \( x < 0 \)
\[ \therefore \text{Dividing up and down by } -x, \text{ we get} \]
\[ \lim_{x \to -\infty} \frac{2 - 3x}{\sqrt{3 + 4x^2}} = \lim_{x \to -\infty} \frac{-2x + 3}{\sqrt{3x^2 + 4}} = \frac{0 + 3}{\sqrt{0 + 4}} = \frac{3}{2} \]

(ii) Here \( \frac{2 - 3x}{\sqrt{3 + 4x^2}} = +\) as \( x > 0 \)
\[ \therefore \text{Dividing up and down by } x, \text{ we get} \]
\[ \lim_{x \to +\infty} \frac{2 - 3x}{\sqrt{3 + 4x^2}} = \lim_{x \to +\infty} \frac{2x + 3}{\sqrt{3x^2 + 4}} = \frac{0 - 3}{\sqrt{0 + 4}} = -\frac{3}{2} \]

1.5.5 \( \lim_{x \to +\infty} \left( 1 + \frac{1}{n} \right)^n = e \)

By the Binomial theorem, we have
\[
\left(1 + \frac{1}{n}\right)^n = 1 + \frac{1}{n} + \frac{1}{n^2} + \frac{1}{n^3} + \frac{1}{n^4} + \ldots
\]
when \( n \to +\infty, \frac{1}{n}, \frac{1}{n^2}, \ldots \) all tend to zero.
\[ \therefore \lim_{n \to +\infty} \left(1 + \frac{1}{n}\right)^n = 1 + 1 + \frac{1}{2!} + \frac{1}{3!} + \frac{1}{4!} + \frac{1}{5!} + \ldots \]
\[ = 1 + 1 + 0.5 + 0.166667 + 0.0416667 + \ldots = 2.718281 \ldots \]

As approximate value of \( e \) is = 2.718281.

1.5.6 \( \lim_{x \to +\infty} \frac{a^n - 1}{x} = \log_a a \)

Put \( a^n - 1 = y \)  
\[ \text{then } a^n = 1 + y \]
So \( x = \log_a (1 + y) \)
From (i) when \( x \to 0, y \to 0 \)
\[ \therefore \lim_{x \to 0} \frac{a^n - 1}{x} = \lim_{y \to 0} \frac{y}{\log_a (1 + y)} = \lim_{y \to 0} \frac{1}{y \log_a (1 + y)} \]

Deduction \( \lim_{x \to 0} \frac{e^{x} - 1}{x} = \log_e e = 1 \)

We know that \( \lim_{x \to 0} \frac{a^n - 1}{x} = \log_a a \)
1. Quadratic Equations

Important Results to Remember

(i) \( \lim_{x \to \infty} (e^x) = \infty \)

(ii) \( \lim_{x \to 0} \left( \frac{a^x}{x} \right) = 0 \), where \( a \) is any real number.

Example 5: Express each limit in terms of the number ‘\( e \)’

(a) \( \lim_{n \to +\infty} \left( 1 + \frac{3}{n} \right)^n \)

(b) \( \lim_{h \to 0} (1+2h)^{\frac{1}{h}} \)

Solution: (a) Observe the resemblance of the limit with

\[ \lim_{n \to \infty} \left( 1 + \frac{1}{n} \right)^n = e \]

\[ \left( 1 + \frac{3}{n} \right)^n = \left( 1 + \frac{3}{n} \right)^{\frac{n}{3}} \left( 1 + \frac{1}{n/3} \right)^{\frac{n}{3}} \]

\[ \therefore \lim_{n \to +\infty} \left( 1 + \frac{3}{n} \right)^n = \lim_{n \to +\infty} \left( 1 + \frac{1}{m} \right)^m = e^3 \]

(b) Observe the resemblance of the limit with \( \lim_{h \to 0} (1 + x)^{\frac{1}{h}} = e \),

\[ \lim_{h \to 0} (1 + 2h)^{\frac{1}{h}} = \lim_{h \to 0} \left( 1 + 2h \right)^{\frac{1}{2h}} \]

\[ = \lim_{m \to +\infty} \left( 1 + m \right)^{\frac{1}{m}} = e^2 \]

1. Functions and Limits

1.5.7 The Sandwich Theorem

Let \( f \) and \( h \) be functions such that \( f(x) \leq g(x) \leq h(x) \) for all numbers \( x \) in some open interval containing “\( c \)”, except possibly at \( c \) itself.

If \( \lim_{x \to c} f(x) = L \) and \( \lim_{x \to c} h(x) = L \), then \( \lim_{x \to c} g(x) = L \)

Many limit problems arise that cannot be directly evaluated by algebraic techniques. They require geometric arguments, so we evaluate an important theorem.

1.5.8 If \( \theta \) is measured in radian, then \( \lim_{\theta \to 0} \frac{\sin \theta}{\theta} = 1 \)

Proof: To evaluate this limit, we apply a new technique. Take \( \theta \) a positive acute central angle of a circle with radius \( r = 1 \). As shown in the figure, \( OAB \) represents a sector of the circle.

Given \( |OA| = |OB| = 1 \) (radii of unit circle)

\[ \therefore \text{In } \triangle OCB, \sin \theta = \frac{|BC|}{|OB|} = |BC| \quad (\because |OB| = 1) \]

\[ \text{In } \triangle OAD, \tan \theta = \frac{|AD|}{|OA|} = |AD| \quad (\because |OA| = 1) \]

In terms of \( \theta \), the areas are expressed as:

Produce \( OB \) to \( D \) so that \( AD \perp OA \). Draw \( BC \perp OA \). Join \( AB \)

(i) Area of \( \triangle OAB = \frac{1}{2} |OA||BC| = \frac{1}{2} (1)(\sin \theta) = \frac{1}{2} \sin \theta \)

(ii) Area of sector \( OAB = \frac{1}{2} r^2 \theta = \frac{1}{2} (1)(\theta) = \frac{1}{2} \theta \) \( (\because r = 1) \)

(iii) Area of \( \triangle OAD = \frac{1}{2} |OA||AD| = \frac{1}{2} (1)(\tan \theta) = \frac{1}{2} \tan \theta \)

From the figure we see that

Area of \( \triangle OAB < \text{Area of sector } OAB < \text{Area of } \triangle OAD \)

\[ \Rightarrow \frac{1}{2} \sin \theta < \frac{\theta}{2} < \frac{1}{2} \tan \theta \]

As \( \sin \theta \) is positive, so on division by \( \frac{1}{2} \sin \theta \), we get
1. Quadratic Equations

(iii)

\[ x^2 - 2x + 1 \]

(iii)

\[ x^2 + 1 \]

(iii)

\[ \sqrt{x^2} + 3 \]

(iii)

\[ \frac{x^2 + 5x}{3x - 2} \]

5. Evaluate each limit by using algebraic techniques.

(ii) \[ \lim_{x \to 1} \frac{3x^2 + 4x}{x + x} \]

(iii) \[ \lim_{x \to 2} \frac{x^2 - 8}{x^2 - 6} \]

(vi) \[ \lim_{x \to 1} \frac{x^2 - 3x + 3x - 1}{x^2 - x} \]

(vi) \[ \lim_{x \to 3} \frac{x^2 - 32}{x^3 - 4x^2} \]

(vii) \[ \lim_{x \to 2} \frac{\sqrt{x^2 - 3} - \sqrt{2}}{h} \]

(vii) \[ \lim_{x \to 1} \frac{x - a^2}{x^2 - a^2} \]

3. Evaluate the following limits

(i) \[ \lim_{x \to 0} \frac{\sin 7x}{x} \]

(ii) \[ \lim_{x \to 0} \frac{\sin x^3}{x} \]

(iii) \[ \lim_{x \to 0} \frac{1 - \cos x}{x^2} \]

(iv) \[ \lim_{x \to 1} \frac{\sin x}{x} \]

(v) \[ \lim_{x \to 1} \frac{\sin x}{\sin x} \]

(vi) \[ \lim_{x \to 0} \frac{x}{\tan x} \]

(viii) \[ \lim_{x \to 0} \frac{\sec x - \cos x}{x} \]

(vii) \[ \lim_{x \to 0} \frac{1 - \cos 2x}{x^2} \]

(x) \[ \lim_{x \to 0} \frac{\sec x - \cos x}{x} \]

(xi) \[ \lim_{x \to 0} \frac{1 - \cos x}{1 - \cos q^2} \]

(xii) \[ \lim_{x \to 0} \frac{\tan x - \sin x}{\sin^2 x} \]

4. Express each limit in terms of \( e \):

(i) \[ \lim_{x \to 0} \frac{1 + \frac{1}{n}}{n} \]

(ii) \[ \lim_{x \to 0} \frac{1 + \frac{1}{n}}{n} \]

(iii) \[ \lim_{x \to 0} \frac{1 - \frac{1}{n}}{n} \]

(iv) \[ \lim_{x \to 0} \frac{1 + \frac{1}{3n}}{n} \]

(v) \[ \lim_{x \to 0} \frac{1 + \frac{4}{n}}{n} \]

(vi) \[ \lim_{x \to 0} (1 + 3x)^2 \]

---

**EXERCISE 1.3**

1. Evaluate each limit by using theorems of limits:

(i) \[ \lim_{x \to 4} (2x + 4) \]

(ii) \[ \lim_{x \to 2} (3x^2 - 2x + 4) \]

(iii) \[ \lim_{x \to 3} \frac{\sqrt{x^2} + x}{4} \]

(iv) \[ \lim_{x \to 2} \frac{2x^2 + 5x}{3x - 2} \]

---

**version: 1.1**
1.6 Continuous and Discontinuous Functions

1.6.1 One-Sided Limits

In defining \( \lim_{x \to c} f(x) \), we restricted \( x \) to an open interval containing \( c \) i.e., we studied the behavior of \( f(x) \) on both sides of \( c \). However, in some cases it is necessary to investigate one-sided limits i.e., the left hand limit and the right hand limit.

(i) The Left Hand Limit

\[ \lim_{x \to c^-} f(x) = L \] is read as the limit of \( f(x) \) is equal to \( L \) as \( x \) approaches \( c \) from the left i.e., for all \( x \) sufficiently close to \( c \), but less than \( c \), the value of \( f(x) \) can be made as close as we please to \( L \).

(ii) The Right Hand Limit

\[ \lim_{x \to c^+} f(x) = M \] is read as the limit of \( f(x) \) is equal to \( M \) as \( x \) approaches \( c \) from the right i.e., for all \( x \) sufficiently close to \( c \), but greater than \( c \), the value of \( f(x) \) can be made as close as we please to \( M \).

1.6.2 Criterion for Existence of Limit of a Function

\( \lim_{x \to c} f(x) = L \) if and only if

\[ \lim_{x \to c^-} f(x) = \lim_{x \to c^+} f(x) = L \]

Example 1: Determine whether \( \lim_{x \to 2} f(x) \) and \( \lim_{x \to 4} f(x) \) exist, when

\( f(x) = \begin{cases} 
2x + 1 & \text{if} \ 0 \leq x < 2 \\
7 - x & \text{if} \ 2 \leq x \leq 4 \\
x & \text{if} \ 4 < x \leq 6 
\end{cases} \)

Solution:

(i) \( \lim_{x \to 2^-} f(x) = \lim_{x \to 2^-} (2x + 1) = 4 + 1 = 5 \)

\( \lim_{x \to 2^+} f(x) = \lim_{x \to 2^+} (7 - x) = 7 - 2 = 5 \)

Since \( \lim_{x \to 2^-} f(x) = \lim_{x \to 2^+} f(x) = 5 \)

\( \Rightarrow \lim_{x \to 2} f(x) \) exists and is equal to 5.

(ii) \( \lim_{x \to 4^-} f(x) = \lim_{x \to 4^-} (7 - x) = 7 - 4 = 3 \)

\( \lim_{x \to 4^+} f(x) = \lim_{x \to 4^+} x = 4 \)

Since \( \lim_{x \to 4^-} f(x) \neq \lim_{x \to 4^+} f(x) \)

Therefore \( \lim_{x \to 4} f(x) \) does not exist.

We have seen that sometimes \( \lim_{x \to c} f(x) \) is not even defined whereas \( \lim_{x \to c^+} f(x) \) exists.

1.6.3 Continuity of a function at a number

(a) Continuous Function

A function \( f \) is said to be continuous at a number \( "c" \) if and only if the following three conditions are satisfied:

(i) \( f(c) \) is defined.

(ii) \( \lim_{x \to c^+} f(x) \) exists.

(iii) \( \lim_{x \to c^-} f(x) = f(c) \)

(b) Discontinuous Function

If one or more of these three conditions fail to hold at \( "c" \), then the function \( f \) is said to be discontinuous at \( "c" \).
1. Quadratic Equations

Example 2: Consider the function \( f(x) = \frac{x^2 - 1}{x - 1} \)

Solution: Here \( f(1) \) is not defined

\[ \Rightarrow f(x) \text{ is discontinuous at } 1. \]

Further \( \lim_{x \to 1} f(x) = \lim_{x \to 1} \frac{x^2 - 1}{x - 1} = \lim_{x \to 1} (x + 1) = 2 \text{ (finite)} \)

Therefore \( f(x) \) is continuous at any other number \( x \neq 1 \)

Example 3: For \( f(x) = 3x^2 - 5x + 4 \), discuss continuity of \( f \) at \( x = 1 \)

Solution:

\[ \begin{align*}
\lim_{x \to 1} f(x) &= \lim_{x \to 1} (3x^2 - 5x + 4) = 3 - 5 + 4 = 2, \\
\text{and } f(1) &= 3 - 5 + 4 = 2 \\
\Rightarrow \lim_{x \to 1} f(x) &= f(1) \\
\therefore f(x) \text{ is continuous at } x = 1
\end{align*} \]

Example 4: Discuss the continuity of the function \( f(x) \) and \( g(x) \) at \( x = 3 \).

(a) \( f(x) = \begin{cases} 
\frac{x^2 - 9}{x - 3} \text{ if } x \neq 3 \\
6 \text{ if } x = 3
\end{cases} \)

Solution: (a) Given \( f(3) = 6 \)

\[ \therefore \text{ the function } f \text{ is defined at } x = 3. \]

Now \( \lim_{x \to 3} f(x) = \lim_{x \to 3} \frac{x^2 - 9}{x - 3} = \lim_{x \to 3} \frac{(x + 3)(x - 3)}{x - 3} = \lim_{x \to 3} (x + 3) = 6 \)

As \( \lim_{x \to 3} f(x) = 6 = f(3) \)

\[ \therefore f(x) \text{ is continuous at } x = 3 \]

(b) \( g(x) = \frac{x^2 - 9}{x - 3} \), if \( x \neq 3 \)

As \( g(x) \) is not defined at \( x = 3 \)

\[ \Rightarrow g(x) \text{ is discontinuous at } x = 3 \]

It is noted that there is a break in the graph at \( x = 3 \)

Example 5: Discuss continuity of \( f \) at 3,

when \( f(x) = \begin{cases} 
\frac{x - 1}{2} \text{ if } x < 3 \\
\frac{2x + 1}{3} \text{ if } x \geq 3
\end{cases} \)

Solution: A sketch of the graph of \( f \) is shown in the figure (iii).

We see that there is a break in the graph at the point when \( x = 3 \)

Now \( f(3) = 2(3) + 1 = 7 \)

\[ \Rightarrow \text{ Condition (i) is satisfied.} \]

\[ \lim_{x \to 3} f(x) = \lim_{x \to 3} (2x + 1) = 6 + 1 = 7 \]

\[ \therefore \lim_{x \to 3} f(x) = \lim_{x \to 3} (2x + 1) \]

i.e. condition (ii) is not satisfied

\[ \therefore \text{ } \lim_{x \to 3} f(x) \text{ does not exist} \]

Hence \( f(x) \) is not continuous at \( x = 3 \)

EXERCISE 1.4

1. Determine the left hand limit and the right hand limit and then, find the limit of the following functions when \( x \to c \)

\[ \begin{align*}
(i) \quad f(x) &= 2x^2 + x - 5, \quad c = 1 \\
(ii) \quad f(x) &= \frac{x^2 - 9}{x - 3}, \quad c = -3 \\
(iii) \quad f(x) &= |x - 5|, \quad c = 5
\end{align*} \]
2. Discuss the continuity of \( f(x) \) at \( x = c \):

\[
(f(x) = \begin{cases} 
2x + 5 & \text{if} \quad x \leq 2 \\
4x + 1 & \text{if} \quad x = 2 \\
3x - 1 & \text{if} \quad x < 1 \\
2x & \text{if} \quad x > 1 
\end{cases}, \quad c = 2
\]

(i) \( f(x) = \begin{cases} 
3x & \text{if} \quad x \leq -2 \\
x^2 - 1 & \text{if} \quad -2 < x < 2 \\
3 & \text{if} \quad x \geq 2 
\end{cases}
\]

(ii) \( f(x) = \begin{cases} 
x + 2 & , \quad x \leq -1 \\
c + 2 & , \quad x > -1 
\end{cases}
\]

Discuss continuity at \( x = 2 \) and \( x = -2 \)

3. If \( f(x) = \begin{cases} 
x + 2 & , \quad x \leq -1 \\
x^2 - 1 & , \quad -2 < x < 2 \\
3 & , \quad x \geq 2 
\end{cases}
\]

4. If \( f(x) = \begin{cases} 
x + 2 & , \quad x \leq -1 \\
x^2 - 1 & , \quad -2 < x < 2 \\
3 & , \quad x \geq 2 
\end{cases}
\]

Find "c" so that \( \lim_{x \to 1} f(x) \) exists.

5. Find the values \( m \) and \( n \), so that given function \( f \) is continuous at \( x = 3 \).

6. If \( f(x) = \begin{cases} 
mx & , \quad x < 3 \\
n & , \quad x = 3 \\
-2x + 9 & , \quad x > 3 
\end{cases}
\]

(i) \( f(x) = \begin{cases} 
mx & , \quad x < 3 \\
x^2 & , \quad x \geq 3 
\end{cases}
\]

6. If \( f(x) = \begin{cases} 
\sqrt{2x + 5} - \sqrt{x + 7} & , \quad x \neq 2 \\
k & , \quad x = 2 
\end{cases}
\]

Find value of \( k \) so that \( f \) is continuous at \( x = 2 \).

1.7 Graphs

We now learn the method to draw the graphs of the Explicit Functions like \( y = f(x) \), where \( f(x) = a^x, \ e^x \), \( \log_a x \), and \( \log_e x \).

1.7.1 Graph of the Exponential Function \( f(x) = a^x \)

Let us draw the graph of \( y = 2^x \), here \( a = 2 \).

We prepare the following table for different values of \( x \) and \( f(x) \) near the origin:

<table>
<thead>
<tr>
<th>( x )</th>
<th>-4</th>
<th>-3</th>
<th>-2</th>
<th>-1</th>
<th>0</th>
<th>1</th>
<th>2</th>
<th>3</th>
<th>4</th>
</tr>
</thead>
<tbody>
<tr>
<td>( y = f(x) = 2^x )</td>
<td>0.0625</td>
<td>0.125</td>
<td>0.25</td>
<td>0.5</td>
<td>1</td>
<td>2</td>
<td>4</td>
<td>8</td>
<td>16</td>
</tr>
</tbody>
</table>

Plotting the points \((x, y)\) and joining them with smooth curve as shown in the figure, we get the graph of \( y = 2^x \).

From the graph of \( 2^x \) the characteristics of the graph of \( y = a^x \) are observed as follows:

(i) \( a^x \) is always +ve for all real values of \( x \).

(ii) \( a^x \) increases as \( x \) increases.

(iii) \( a^x = 1 \) when \( x = 0 \)

(iv) \( a^x \to 0 \) as \( x \to -\infty \)

1.7.2 Graph of the Exponential Function \( f(x) = e^x \)

As the approximate value of 'e' is 2.718

The graph of \( e^x \) has the same characteristics and properties as that of \( a^x \) when \( a > 1 \) (discussed above).

We prepare the table of some values of \( x \) and \( f(x) \) near the origin as follows:
1. Quadratic Equations

<table>
<thead>
<tr>
<th>x</th>
<th>-3</th>
<th>-2</th>
<th>-1</th>
<th>0</th>
<th>1</th>
<th>2</th>
<th>3</th>
</tr>
</thead>
<tbody>
<tr>
<td>y</td>
<td>0.05</td>
<td>0.135</td>
<td>0.36</td>
<td>1</td>
<td>2.718</td>
<td>7.38</td>
<td>20.07</td>
</tr>
</tbody>
</table>

Plotting the points \((x, y)\) and joining them with smooth curve as shown, we get the graph of \(y = e^x\).

1. Functions and Limits

1.7.3 Graph of Common Logarithmic Function \(f(x) = \lg x\).

If \(x = 10^r\), then \(y = \lg x\).

Now for all real values of \(y\), \(10^y > 0 \implies x > 0\).

This means \(\lg x\) exists only when \(x > 0\).

\(\implies\) Domain of the \(\lg x\) is +ve real numbers.

Note: \(\lg x\) is undefined at \(x = 0\).

For graph of \(f(x) = \lg x\), we find the values of \(\lg x\) from the common logarithmic table for various values of \(x > 0\).

Table of some of the corresponding values of \(x\) and \(f(x) = \lg x\) is as under:

<table>
<thead>
<tr>
<th>(x)</th>
<th>(-\infty)</th>
<th>0</th>
<th>0.1</th>
<th>1</th>
<th>2</th>
<th>4</th>
<th>6</th>
<th>8</th>
<th>10</th>
<th>(+\infty)</th>
</tr>
</thead>
<tbody>
<tr>
<td>(y = f(x) = \lg x)</td>
<td>(-\infty)</td>
<td>0</td>
<td>0.30</td>
<td>0.60</td>
<td>0.77</td>
<td>0.90</td>
<td>1</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Plotting the points \((x, y)\) and joining them with a smooth curve we get the graph as shown in the figure.

1.7.4 Graphs of Natural Logarithmic Function \(f(x) = \ln x\):

The graph of \(f(x) = \ln x\) has similar properties as that of the graph of \(f(x) = \lg x\).

By using the table of natural logarithm for various values of \(x\), we get the graph of \(y = \ln x\) as shown in the figure.

1.7.5 Graphs of Implicit Functions

(a) Graph of the circle of the form \(x^2 + y^2 = a^2\)

Example 1: Graph the circle \(x^2 + y^2 = 4\) \(\quad (1)\)

Solution: The graph of the equation \(x^2 + y^2 = 4\) is a circle of radius 2, centered at the origin and hence there are vertical lines that cut the graph more than once. This can also be seen algebraically by solving \((1)\) for \(y\) in terms of \(x\).

\[y = \pm \sqrt{4-x^2}\]

The equation does not define \(y\) as a function of \(x\).

For example, if \(x = 1\), then \(y = \pm \sqrt{3}\).

Hence \((1, \sqrt{3})\) and \((1, -\sqrt{3})\) are two points on the circle and vertical line passes through these two points.

We can regard the circle as the union of two semi-circles.

\[y = \sqrt{4-x^2}\quad \text{and} \quad y = -\sqrt{4-x^2}\]

Each of which defines \(y\) as a function of \(x\).

We observe that if we replace \((x, y)\) in turn by \((-x, y)\), \((x, -y)\) and \((-x, -y)\), there is no change in the given equation. Hence the graph is symmetric with respect to the y-axis, x-axis and the origin.

\[x = 0 \implies \quad y^2 = 4 \implies y = \pm 2\]

\[x = 1 \implies \quad y^2 = 3 \implies y = \pm \sqrt{3}\]

\[x = 2 \implies \quad y^2 = 0 \implies y = 0\]

By assigning values of \(x\), we find the values of \(y\). So we prepare a table for some values of \(x\) and \(y\) satisfying equation \((1)\).
1. Quadratic Equations

### Functions and Limits

1. Quadratic Equations

#### Example 1:

Graph:

\[ x = t^2, \quad y = t \quad -2 \leq t \leq 2 \]  

#### Solution:

For the choice of \( t \) in \([-2, 2]\), we prepare a table for some values of \( x \) and \( y \) satisfying the given equation.

<table>
<thead>
<tr>
<th>( t )</th>
<th>-2</th>
<th>-1</th>
<th>0</th>
<th>1</th>
<th>2</th>
</tr>
</thead>
<tbody>
<tr>
<td>( x )</td>
<td>4</td>
<td>1</td>
<td>0</td>
<td>1</td>
<td>4</td>
</tr>
<tr>
<td>( y )</td>
<td>-2</td>
<td>-1</td>
<td>0</td>
<td>1</td>
<td>2</td>
</tr>
</tbody>
</table>

We plot the points \((x, y)\), connecting these points with a smooth curve shown in the figure, we obtain the graph of a parabola with equation \( y^2 = x \).

#### Example 2:

Graph the curve that has the parametric equations

\[ x = t^2, \quad y = t \quad -2 \leq t \leq 2 \]  

#### Solution:

For the choice of \( t \) in \([-2, 2]\), we prepare a table for some values of \( x \) and \( y \) satisfying the given equation.

<table>
<thead>
<tr>
<th>( t )</th>
<th>-2</th>
<th>-1</th>
<th>0</th>
<th>1</th>
<th>2</th>
</tr>
</thead>
<tbody>
<tr>
<td>( x )</td>
<td>4</td>
<td>1</td>
<td>0</td>
<td>1</td>
<td>4</td>
</tr>
<tr>
<td>( y )</td>
<td>-2</td>
<td>-1</td>
<td>0</td>
<td>1</td>
<td>2</td>
</tr>
</tbody>
</table>

We plot the points \((x, y)\), connecting these points with a smooth curve shown in the figure, we obtain the graph of a parabola with equation \( y^2 = x \).

#### 1.7.5 Graph of parametric Equations

(a) Graph the curve that has the parametric equations

\[ x = t^2, \quad y = t \quad -2 \leq t \leq 2 \]  

#### Solution:

For the choice of \( t \) in \([-2, 2]\), we prepare a table for some values of \( x \) and \( y \) satisfying the given equation.

<table>
<thead>
<tr>
<th>( t )</th>
<th>-2</th>
<th>-1</th>
<th>0</th>
<th>1</th>
<th>2</th>
</tr>
</thead>
<tbody>
<tr>
<td>( x )</td>
<td>4</td>
<td>1</td>
<td>0</td>
<td>1</td>
<td>4</td>
</tr>
<tr>
<td>( y )</td>
<td>-2</td>
<td>-1</td>
<td>0</td>
<td>1</td>
<td>2</td>
</tr>
</tbody>
</table>

We plot the points \((x, y)\), connecting these points with a smooth curve shown in the figure, we obtain the graph of a parabola with equation \( y^2 = x \).

#### 1.7.6 Graphs of Discontinuous Functions

#### Example 1:

Graph the function defined by

\[ y = \begin{cases} x & \text{when } 0 \leq x \leq 1 \\ x - 1 & \text{when } 1 < x \leq 2 \end{cases} \]

#### Solution:

The domain of the function is \( 0 \leq x \leq 2 \)

For \( 0 \leq x \leq 1 \), the graph of the function is that of \( y = x \)

and for \( 1 < x \leq 2 \), the graph of the function is that of \( y = x - 1 \)

We prepare the table for some values of \( x \) and \( y \) in \( 0 \leq x \leq 2 \) satisfying the equations \( y = x \) and \( y = x - 1 \)

<table>
<thead>
<tr>
<th>( x )</th>
<th>0</th>
<th>0.5</th>
<th>0.8</th>
<th>1</th>
<th>1.5</th>
<th>1.8</th>
<th>2</th>
</tr>
</thead>
<tbody>
<tr>
<td>( y )</td>
<td>0</td>
<td>0.5</td>
<td>0.8</td>
<td>1</td>
<td>0.5</td>
<td>0.8</td>
<td>1</td>
</tr>
</tbody>
</table>

### Graphs of Discontinuous Functions

#### Example 1:

Graph the function defined by

\[ y = \begin{cases} x & \text{when } 0 \leq x \leq 1 \\ x - 1 & \text{when } 1 < x \leq 2 \end{cases} \]

#### Solution:

The domain of the function is \( 0 \leq x \leq 2 \)

For \( 0 \leq x \leq 1 \), the graph of the function is that of \( y = x \)

and for \( 1 < x \leq 2 \), the graph of the function is that of \( y = x - 1 \)

We prepare the table for some values of \( x \) and \( y \) in \( 0 \leq x \leq 2 \) satisfying the equations \( y = x \) and \( y = x - 1 \)

<table>
<thead>
<tr>
<th>( x )</th>
<th>0</th>
<th>0.5</th>
<th>0.8</th>
<th>1</th>
<th>1.5</th>
<th>1.8</th>
<th>2</th>
</tr>
</thead>
<tbody>
<tr>
<td>( y )</td>
<td>0</td>
<td>0.5</td>
<td>0.8</td>
<td>1</td>
<td>0.5</td>
<td>0.8</td>
<td>1</td>
</tr>
</tbody>
</table>

### Graphs of Discontinuous Functions

#### Example 1:

Graph the function defined by

\[ y = \begin{cases} x & \text{when } 0 \leq x \leq 1 \\ x - 1 & \text{when } 1 < x \leq 2 \end{cases} \]

#### Solution:

The domain of the function is \( 0 \leq x \leq 2 \)

For \( 0 \leq x \leq 1 \), the graph of the function is that of \( y = x \)

and for \( 1 < x \leq 2 \), the graph of the function is that of \( y = x - 1 \)

We prepare the table for some values of \( x \) and \( y \) in \( 0 \leq x \leq 2 \) satisfying the equations \( y = x \) and \( y = x - 1 \)

<table>
<thead>
<tr>
<th>( x )</th>
<th>0</th>
<th>0.5</th>
<th>0.8</th>
<th>1</th>
<th>1.5</th>
<th>1.8</th>
<th>2</th>
</tr>
</thead>
<tbody>
<tr>
<td>( y )</td>
<td>0</td>
<td>0.5</td>
<td>0.8</td>
<td>1</td>
<td>0.5</td>
<td>0.8</td>
<td>1</td>
</tr>
</tbody>
</table>
Plot the points \((x, y)\). Connecting these points we get two straight lines, which is the graph of a discontinuous function.

**Example 2:** Graph the function defined by \( y = \frac{x^2 - 9}{x - 3}, \quad x \neq 3 \)

**Solution:** The domain of the function consists of all real numbers except 3.

When \( x = 3 \), both the numerator and denominator are zero, and \( \frac{0}{0} \) is undefined.

Simplifying we get \( y = \frac{x^2 - 9}{x - 3} = \frac{(x - 3)(x + 3)}{x - 3} = x + 3 \) provided \( x \neq 3 \).

We prepare a table for different values of \( x \) and \( y \) satisfy the equation \( y = x + 3 \) and \( x \neq 3 \).

<table>
<thead>
<tr>
<th>( x )</th>
<th>(-3)</th>
<th>(-2)</th>
<th>(-1)</th>
<th>(0)</th>
<th>(1)</th>
<th>(2)</th>
<th>(2.9)</th>
<th>(3)</th>
<th>(3.1)</th>
<th>(4)</th>
</tr>
</thead>
<tbody>
<tr>
<td>( y )</td>
<td>0</td>
<td>1</td>
<td>2</td>
<td>3</td>
<td>4.9</td>
<td>6</td>
<td>5.9</td>
<td>6</td>
<td>6.1</td>
<td>7</td>
</tr>
</tbody>
</table>

Plot the points \((x, y)\) and joining these points we get the graph of the function which is a straight line except the point \((3, 6)\).

The graph is shown in the figure. This is a broken straight line with a break at the point \((3, 6)\).

1.7.7 Graphical Solution of the Equations

(i) \( \cos x = x \)  
(ii) \( \sin x = x \)  
(iii) \( \tan x = x \)

We solve the equation \( \cos x = x \) and leave the other two equations as an exercise for the students.

**Solution:** To find the solution of the equation \( \cos x = x \), we draw the graphs of the two functions \( y = x \) and \( y = \cos x \) : \( -\pi \leq x \leq \pi \)

The graph shows that the equations \( y = x \) and \( y = \cos x \) intersect at only where \( x = \frac{43}{180} \) radian = 0.73

**Check:** \( \cos \left( \frac{43}{180} \pi \right) = \cos 43^\circ = 0.73 \)
1. **Functions and Limits**

**Note:** Since the scales along the two axes are different so the line $y = x$ is not equally inclined to both the axes.

---

**EXERCISE 1.5**

1. Draw the graphs of the following equations
   
   (i) $x^2 + y^2 = 9$  
   (ii) $\frac{x^2}{16} + \frac{y^2}{4} = 1$
   
   (iii) $y = e^{2x}$  
   (iv) $y = 3^x$

2. Graph the curves that has the parametric equations given below
   
   (i) $x = t$, $y = t^2$, $-3 \leq t \leq 3$ where “$t$” is a parameter
   (ii) $x = t - 1$, $y = 2t - 1$, $-1 < t < 5$ where “$t$” is a parameter
   (iii) $x = \sec \theta$, $y = \tan \theta$ where “$\theta$” is a parameter

3. Draw the graphs of the functions defined below and find whether they are continuous.
   
   (i) $y = \begin{cases} x - 1 & \text{if } x < 3 \\ 2x + 1 & \text{if } x \geq 3 \end{cases}$
   (ii) $y = \frac{x^2 - 4}{x - 2}$ for $x \neq 2$
   (iii) $y = \begin{cases} x + 3 & \text{if } x \neq 3 \\ 2 & \text{if } x = 3 \end{cases}$
   (iv) $y = \frac{x^2 - 16}{x - 4}$ for $x \neq 4$

4. Find the graphical solution of the following equations:
   
   (i) $x = \sin 2x$
   (ii) $\frac{x}{2} = \cos x$
   (iii) $2x = \tan x$
